About

Data Science engineering student at ESPRIT, I build intelligent systems end-to-end — from machine-learning models to NLP and multi-agent AI, through to API deployment with Docker and CI/CD. I am seeking a **final-year internship (PFE) abroad** in Data Science / AI, starting February 2027. This document highlights my main projects; the live portfolio is at aziztemimii.github.io.

Core Skills

Machine Learning	Regression, Classification, Clustering, PCA, Reinforcement Learning
Deep Learning / NLP	CNN, RNN / LSTM, Transformers, CBAM attention, NLP
Generative AI	Multi-agent systems, RAG, LlamaIndex, ReAct agents, pgvector, NeMo Guardrails
Engineering	Python, PyTorch, FastAPI, Flask, SQL, Git, Docker, GitHub Actions

Selected Projects

LinkedLevel — Multi-Agent AI Chatbot

Internship — Obeya IT | 2026

AI assistant for the LinkedLevel platform, powered by cooperating agents: a ReAct orchestrator routes each query to a RAG agent (document search over pgvector) or a Data agent for structured business data. Includes a voice interface (STT/TTS), automatic report generation, multilingual support and NeMo guardrails for safe responses.

Tech: FastAPI • LlamaIndex • ReAct • pgvector • RAG • NeMo • Voice

Breast Cancer Lesion Detection — Deep Learning + Reinforcement Learning

Team Project | 2025

Computer-vision pipeline on DICOM mammograms (INbreast) combining a CBAM-attention CNN and a PPO curiosity-driven RL agent that learns where to look. Breast region segmented with Otsu + morphology; 64×64 patches classified with Focal Loss; evaluated with Precision, Recall, F1 and Specificity; deployed as an HTTP API with Docker. **My contribution: the RL + CNN core** (data preprocessing, CBAM CNN, PPO environment).

Tech: Python • PyTorch • CNN • CBAM • Reinforcement Learning • PPO • Docker

MediNote — Multi-Agent Medical Report Platform

Team Project (ESPRIT) | 2026

Intelligent platform to analyze and score medical visit reports (VITAL), built on a multi-agent architecture over a role-aware, JWT-secured data API. **My contribution: the orchestrator agent** (routing each query to the right agent), **the data agent** (querying structured business data) and **the analysis agent** (evaluating report quality and extracting key insights).

Tech: Multi-Agent • Orchestrator • Data Agent • NLP • Python

MLOps Pipeline — Modular ML Lifecycle with CI/CD

Personal Project | 2025

Machine-learning pipeline split into independent stages (prepare, train, evaluate, save, load) with three interchangeable classifiers (Random Forest, AdaBoost, XGBoost). Model and scaler are persisted together to avoid train/serve skew, and a GitHub Actions workflow runs an end-to-end smoke test on every push.

Worker Productivity ML Platform

Team Project | 2025

Flask web application deploying a suite of ML models around garment-worker productivity: regression (productivity gap, extra time), classification (overtime, task intensity) and clustering (team workload with K-Means & GMM, incentive segmentation). Each model is served through its own prediction page and JSON API endpoint, with shared preprocessing.

E-Transfert & E-Trade — Banking Platforms

GTI | 2024–2025

Two banking web platforms built at GTI: E-Transfert (summer internship) digitalizes the bank transfer process on a microservices architecture; E-Trade (bachelor's final-year project) manages bank transfers and import documentary credits, automating their processing and modeling the financial data.
